Abstract model theory

Consider:

- \mathcal{L} — a **language** (any set; its elements are called **formulas**)
- \mathcal{S} — a class of **structures** or **models**
- \models — a **truth** relation: $M \models A$ between $M \in \mathcal{S}$ and $A \in \mathcal{L}$

Abstract model theory

Consider:

- \mathcal{L} — a **language** (any set; its elements are called **formulas**)
- \mathcal{S} — a class of **structures** or **models**
- \models — a **truth** relation: $M \models A$ between $M \in \mathcal{S}$ and $A \in \mathcal{L}$

How can we “characterize”

- classes of models from \mathcal{S} definable by a single formula from \mathcal{L} ?
- classes of models from \mathcal{S} definable by a set of formulas from \mathcal{L} ?

Abstract model theory

Consider:

- \mathcal{L} — a **language** (any set; its elements are called **formulas**)
- \mathcal{S} — a class of **structures** or **models**
- \models — a **truth** relation: $M \models A$ between $M \in \mathcal{S}$ and $A \in \mathcal{L}$

How can we “characterize”

- classes of models from \mathcal{S} definable by a single formula from \mathcal{L} ?
- classes of models from \mathcal{S} definable by a set of formulas from \mathcal{L} ?

For a set of formulas $\Gamma \subseteq \mathcal{L}$ and a class of models $\mathbb{K} \subseteq \mathcal{S}$, we denote:

$$\begin{aligned}\text{Models}(\Gamma) &:= \{M \in \mathcal{S} \mid M \models \Gamma\} \\ \text{Theory}(\mathbb{K}) &:= \{A \in \mathcal{L} \mid \mathbb{K} \models A\}\end{aligned}$$

The 4 “species” of classes

Definition. For a class of models $\mathbb{K} \subseteq \mathcal{S}$ we write:

$\mathbb{K} \in \mathcal{L}$ if $\mathbb{K} = \text{Models}(A)$, for some formula $A \in \mathcal{L}$.

The 4 “species” of classes

Definition. For a class of models $\mathbb{K} \subseteq \mathcal{S}$ we write:

$\mathbb{K} \in \mathbb{L}$ if $\mathbb{K} = \text{Models}(A)$, for some formula $A \in \mathcal{L}$.

$\mathbb{K} \in \cap\mathbb{L}$ if $\mathbb{K} = \text{Models}(\Gamma)$, for some set of formulas $\Gamma \subseteq \mathcal{L}$.

Equivalently: if $\mathbb{K} = \bigcap_{i \in I} \mathbb{K}_i$; for some classes $\mathbb{K}_i \in \mathbb{L}$.

The 4 “species” of classes

Definition. For a class of models $\mathbb{K} \subseteq \mathcal{S}$ we write:

$\mathbb{K} \in \mathbb{L}$ if $\mathbb{K} = \text{Models}(A)$, for some formula $A \in \mathcal{L}$.

$\mathbb{K} \in \cap \mathbb{L}$ if $\mathbb{K} = \text{Models}(\Gamma)$, for some set of formulas $\Gamma \subseteq \mathcal{L}$.

Equivalently: if $\mathbb{K} = \bigcap_{i \in I} \mathbb{K}_i$; for some classes $\mathbb{K}_i \in \mathbb{L}$.

$\mathbb{K} \in \cup \mathbb{L}$ if $\mathbb{K} = \bigcup_{i \in I} \mathbb{K}_i$; for some classes $\mathbb{K}_i \in \mathbb{L}$.

The 4 “species” of classes

Definition. For a class of models $\mathbb{K} \subseteq \mathcal{S}$ we write:

$\mathbb{K} \in \mathbb{L}$ if $\mathbb{K} = \text{Models}(A)$, for some formula $A \in \mathcal{L}$.

$\mathbb{K} \in \cap \mathbb{L}$ if $\mathbb{K} = \text{Models}(\Gamma)$, for some set of formulas $\Gamma \subseteq \mathcal{L}$.

Equivalently: if $\mathbb{K} = \bigcap_{i \in I} \mathbb{K}_i$ for some classes $\mathbb{K}_i \in \mathbb{L}$.

$\mathbb{K} \in \cup \mathbb{L}$ if $\mathbb{K} = \bigcup_{i \in I} \mathbb{K}_i$ for some classes $\mathbb{K}_i \in \mathbb{L}$.

$\mathbb{K} \in \cup \cap \mathbb{L}$ if $\mathbb{K} = \bigcup_{i \in I} \bigcap_{j \in J_i} \mathbb{K}_{i,j}$ for some classes $\mathbb{K}_{i,j} \in \mathbb{L}$.

The 4 “species” of classes

Definition. For a class of models $\mathbb{K} \subseteq \mathcal{S}$ we write:

$\mathbb{K} \in \mathcal{L}$ if $\mathbb{K} = \text{Models}(A)$, for some formula $A \in \mathcal{L}$.

$\mathbb{K} \in \mathcal{NL}$ if $\mathbb{K} = \text{Models}(\Gamma)$, for some set of formulas $\Gamma \subseteq \mathcal{L}$.

Equivalently: if $\mathbb{K} = \bigcap_{i \in I} \mathbb{K}_i$ for some classes $\mathbb{K}_i \in \mathcal{L}$.

$\mathbb{K} \in \mathcal{UL}$ if $\mathbb{K} = \bigcup_{i \in I} \mathbb{K}_i$ for some classes $\mathbb{K}_i \in \mathcal{L}$.

$\mathbb{K} \in \mathcal{UNL}$ if $\mathbb{K} = \bigcup_{i \in I} \bigcap_{j \in J_i} \mathbb{K}_{i,j}$ for some classes $\mathbb{K}_{i,j} \in \mathcal{L}$.

For the “elementary” (i.e. first-order) language \mathcal{L} , the terminology is:

$\mathbb{K} \in \mathcal{L}$ — an **elementary** class of models (*finitely axiomatizable*)

$\mathbb{K} \in \mathcal{NL}$ — a **Δ -elementary** class of models (*axiomatizable*)

$\mathbb{K} \in \mathcal{UL}$ — a **Σ -elementary** class of models (*co-axiomatizable?*)

$\mathbb{K} \in \mathcal{UNL}$ — a **$\Sigma\Delta$ -elementary** class of models

The hierarchy of the 4 species of classes

The hierarchy of the 4 species of classes

- Classes in \mathbb{L} : the classes of all groups, all rings, all fields
- Classes in $\cap\mathbb{L}$: infinite groups, infinite rings, infinite fields
- Classes in $\cup\mathbb{L}$: finite groups, finite rings, finite fields
- Classes in $\cap\cup\mathbb{L}$: infinite fields of characteristic $p > 0$;
infinite finitely dimensional vector spaces
- Not even in $\cap\cup\mathbb{L}$: well-ordered sets, periodic groups, simple groups

Isomorphism of two models

$M \cong N \iff \exists$ bijection that preserves all predicates and functions

Isomorphism of two models

$M \cong N \iff \exists$ bijection that preserves all predicates and functions

Elementary equivalence of two models

$M \equiv_{\text{FO}} N \iff$ for every formula $A \in \text{FO}$: $M \models A \iff N \models A$

First-order language: Relations / functions between models

Isomorphism of two models

$M \cong N \iff \exists$ bijection that preserves all predicates and functions

Elementary equivalence of two models

$M \equiv_{\text{FO}} N \iff$ for every formula $A \in \text{FO}$: $M \models A \iff N \models A$

Ultraproduct of a family of models: $M = \prod_{i \in I}^U M_i$

Łós' Theorem: $M \models A \iff \{i \in I \mid M_i \models A\} \in U$

First-order language: Relations / functions between models

Isomorphism of two models

$M \cong N \iff \exists$ bijection that preserves all predicates and functions

Elementary equivalence of two models

$M \equiv_{\text{FO}} N \iff$ for every formula $A \in \text{FO}$: $M \models A \iff N \models A$

Ultraproduct of a family of models: $M = \prod_{i \in I}^U M_i$

Łós' Theorem: $M \models A \iff \{i \in I \mid M_i \models A\} \in U$

Ultrapower of a model N

If every $M_i = N$ then their ultraproduct is called the ultrapower: $M = N^U$

A model and its ultrapower are elementary equivalent: $N \equiv_{\text{FO}} N^U$

Theorem (Keisler, 1961)

	Both	\mathbb{K}	$\overline{\mathbb{K}}$
$\mathbb{K} \in \cup \mathbb{L}$	\equiv_{FO}		
$\mathbb{K} \in \cup \mathbb{L}$	\equiv_{FO}		$\forall \Pi$
$\mathbb{K} \in \cap \mathbb{L}$	\equiv_{FO}	$\forall \Pi$	
$\mathbb{K} \in \mathbb{L}$	\equiv_{FO}	$\forall \Pi$	$\forall \Pi$

Legend: $\forall \Pi$ = ultraproduct

First-order language | Criteria for the 4 species

Theorem (Keisler, 1961)

	Both	\mathbb{K}	$\overline{\mathbb{K}}$
$\mathbb{K} \in \cup \cap \mathbb{L}$	\equiv_{FO}		
$\mathbb{K} \in \cup \mathbb{L}$	\equiv_{FO}		$\forall \Pi$
$\mathbb{K} \in \cap \mathbb{L}$	\equiv_{FO}	$\forall \Pi$	
$\mathbb{K} \in \mathbb{L}$	\equiv_{FO}	$\forall \Pi$	$\forall \Pi$

(Keisler, 1961; Shelah, 1971)

	Both	\mathbb{K}	$\overline{\mathbb{K}}$
$\mathbb{K} \in \cup \cap \mathbb{L}$	\cong	$\forall C$	$\forall C$
$\mathbb{K} \in \cup \mathbb{L}$	\cong	$\forall C$	$\forall \Pi$
$\mathbb{K} \in \cap \mathbb{L}$	\cong	$\forall \Pi$	$\forall C$
$\mathbb{K} \in \mathbb{L}$	\cong	$\forall \Pi$	$\forall \Pi$

Legend: $\forall \Pi$ = ultraproduct
 $\forall C$ = ultrapower

Theorem (Keisler, 1961)

	Both	\mathbb{K}	$\overline{\mathbb{K}}$
$\mathbb{K} \in \mathcal{U} \cap \mathcal{L}$	\equiv_{FO}		
$\mathbb{K} \in \mathcal{U} \setminus \mathcal{L}$	\equiv_{FO}		$\forall \Pi$
$\mathbb{K} \in \mathcal{L} \setminus \mathcal{U}$	\equiv_{FO}	$\forall \Pi$	
$\mathbb{K} \in \mathcal{L}$	\equiv_{FO}	$\forall \Pi$	$\forall \Pi$

(Keisler, 1961; Shelah, 1971)

	Both	\mathbb{K}	$\overline{\mathbb{K}}$
$\mathbb{K} \in \mathcal{U} \cap \mathcal{L}$	\cong	$\forall \mathcal{C}$	$\forall \mathcal{C}$
$\mathbb{K} \in \mathcal{U} \setminus \mathcal{L}$	\cong	$\forall \mathcal{C}$	$\forall \Pi$
$\mathbb{K} \in \mathcal{L} \setminus \mathcal{U}$	\cong	$\forall \Pi$	$\forall \mathcal{C}$
$\mathbb{K} \in \mathcal{L}$	\cong	$\forall \Pi$	$\forall \Pi$

Legend: $\forall \Pi$ = ultraproduct
 $\forall \mathcal{C}$ = ultrapower

Main reason for the symmetry in the above tables:

$$M \not\models A \iff M \models \neg A$$

Modal language | Kripke semantics

Formulas: p_i | $\neg A$ | $(A \wedge B)$ | $(A \vee B)$ | $(A \rightarrow B)$ | $\Box A$

Formulas: p_i | $\neg A$ | $(A \wedge B)$ | $(A \vee B)$ | $(A \rightarrow B)$ | $\Box A$

Kripke semantics:

Kripke model: $M = (W, R, V)$, where

$W \neq \emptyset$ — a nonempty set of **worlds**

$R \subseteq W \times W$ — a **accessibility** relation between worlds

$V(p_i) \subseteq W$ — a **valuation** of variables

Modal language | Kripke semantics

Formulas: $p_i \mid \neg A \mid (A \wedge B) \mid (A \vee B) \mid (A \rightarrow B) \mid \Box A$

Kripke semantics:

Kripke model: $M = (W, R, V)$, where

$W \neq \emptyset$ — a nonempty set of **worlds**

$R \subseteq W \times W$ — a **accessibility** relation between worlds

$V(p_i) \subseteq W$ — a **valuation** of variables

Truth of a formula is defined in a **pointed model** (M, x) :

$$M, x \models p_i \quad \Leftrightarrow \quad x \in V(p_i)$$

$$M, x \models \neg A \quad \Leftrightarrow \quad M, x \not\models A$$

$$M, x \models A \wedge B \quad \Leftrightarrow \quad M, x \models A \quad \text{and} \quad M, x \models B$$

$$M, x \models A \vee B \quad \Leftrightarrow \quad M, x \models A \quad \text{or} \quad M, x \models B$$

$$M, x \models A \rightarrow B \quad \Leftrightarrow \quad M, x \models A \Rightarrow M, x \models B$$

$$M, x \models \Box A \quad \Leftrightarrow \quad \text{for every } y \in W (x R y \Rightarrow M, y \models A)$$

Truth of a formula in a **model**: $M \models A$ if $\forall x \in W \quad M, x \models A$.

Modal equivalence of two (pointed) Kripke models

$$M \equiv_{\text{ML}} N \iff \text{for every formula } A \in \text{ML}: M \models A \iff N \models A$$

Modal equivalence of two (pointed) Kripke models

$M \equiv_{ML} N \iff$ for every formula $A \in ML$: $M \models A \iff N \models A$

Bisimulation between two pointed Kripke models

$M, a \simeq N, b$ — respects the valuation of variables
every step in M is “simulated” by some step in N
every step in N is “simulated” by some step in M

Modal equivalence of two (pointed) Kripke models

$M \equiv_{\text{ML}} N \iff$ for every formula $A \in \text{ML}$: $M \models A \iff N \models A$

Bisimulation between two pointed Kripke models

$M, a \simeq N, b$ — respects the valuation of variables
every step in M is “simulated” by some step in N
every step in N is “simulated” by some step in M

Global bisimulation between Kripke models

$M \text{ :}\simeq\text{ :} N$ — bisimulation that covers the whole models M and N

Modal equivalence of two (pointed) Kripke models

$$M \equiv_{\text{ML}} N \iff \text{for every formula } A \in \text{ML}: M \models A \iff N \models A$$

Bisimulation between two pointed Kripke models

$M, a \simeq N, b$ — respects the valuation of variables
every step in M is “simulated” by some step in N
every step in N is “simulated” by some step in M

Global bisimulation between Kripke models

$M \text{ :}\simeq\text{ :} N$ — bisimulation that covers the whole models M and N

Generated submodel: $M \hookrightarrow N$

Disjoint union of models: $M = \bigsqcup_{i \in I} M_i$

Modal language | Criteria in terms of $\mathcal{U}\Pi$ and $\mathcal{U}\mathcal{C}$

Theorem: for pointed Kripke models (Maarten de Rijke, 1993)

	Both	\mathbb{K}	$\overline{\mathbb{K}}$
$\mathbb{K} \in \mathcal{U}\mathcal{N}\mathcal{L}$	\equiv_{ML}		
$\mathbb{K} \in \mathcal{U}\mathcal{L}$	\equiv_{ML}		$\mathcal{U}\Pi$

Modal language: “purely modal” operations on models

Ultra-extension of a Kripke model $M = (W, R, V)$

— is a Kripke model $M^{uc} = (W^{uc}, R^{uc}, V^{uc})$, where

worlds:	W^{uc}	— all ultrafilters over the set W ;
relation:	$\alpha R^{uc} \beta$	$\Leftrightarrow \forall X \subseteq W (\Diamond X \in \alpha \Leftarrow X \in \beta)$ $\Leftrightarrow \forall X \subseteq W (\Box X \in \alpha \Rightarrow X \in \beta)$
valuation:	$\alpha \models p_i$	$\Leftrightarrow V(p_i) \in \alpha$

Modal language: “purely modal” operations on models

Ultra-extension of a Kripke model $M = (W, R, V)$

— is a Kripke model $M^{uc} = (W^{uc}, R^{uc}, V^{uc})$, where

worlds: W^{uc} — all ultrafilters over the set W ;
relation: $\alpha R^{uc} \beta \Leftrightarrow \forall X \subseteq W (\Diamond X \in \alpha \Leftrightarrow X \in \beta)$
 $\Leftrightarrow \forall X \subseteq W (\Box X \in \alpha \Rightarrow X \in \beta)$
valuation: $\alpha \models p_i \Leftrightarrow V(p_i) \in \alpha$

A model and its ultra-extension are modally equivalent: $M \equiv_{ML} M^{uc}$

Modal language: “purely modal” operations on models

Ultra-extension of a Kripke model $M = (W, R, V)$

— is a Kripke model $M^{uc} = (W^{uc}, R^{uc}, V^{uc})$, where

worlds: W^{uc} — all ultrafilters over the set W ;
relation: $\alpha R^{uc} \beta \Leftrightarrow \forall X \subseteq W (\Diamond X \in \alpha \Leftrightarrow X \in \beta)$
 $\Leftrightarrow \forall X \subseteq W (\Box X \in \alpha \Rightarrow X \in \beta)$
valuation: $\alpha \models p_i \Leftrightarrow V(p_i) \in \alpha$

A model and its ultra-extension are modally equivalent: $M \equiv_{ML} M^{uc}$

Ultra-union of a family of pointed Kripke models $(M_i, a_i)_{i \in I}$

$M = ((\biguplus_{i \in I} M_i)^{uc}, \alpha)$, all co-finite subsets of $\{\langle a_i, i \rangle \mid i \in I\}$ are in α .

Observation. Ultra-union behaves like the ultra-product.

Further directions

- Criteria for other semantics of the modal language:
 - neighbourhood semantics
 - topological semantics
 - algebraic semantics

Further directions

- Criteria for other semantics of the modal language:
 - neighbourhood semantics
 - topological semantics
 - algebraic semantics
- Criteria for other languages:
 - add modalities: converse (tense) \Box^{-1} , inequality $[\neq]$, transitive closure \boxplus , graded modalities $\Diamond^{\geq n}$, hybrid logic (nominals) $@_i$
 - infinitary modal language (for any set Φ of formulas $\bigwedge \Phi$ is a formula):
 - classes of models definable by a **single** infinitary modal formula,
 - classes of models definable by a **class (!)** of infinitary modal formula,
 - intuitionistic propositional language
 - modal predicate language

Further directions

- Criteria for other semantics of the modal language:
 - neighbourhood semantics
 - topological semantics
 - algebraic semantics
- Criteria for other languages:
 - add modalities: converse (tense) \square^{-1} , inequality $[\neq]$, transitive closure \boxplus , graded modalities $\diamond^{\geq n}$, hybrid logic (nominals) $@$;
 - infinitary modal language (for any set Φ of formulas $\bigwedge \Phi$ is a formula):
 - classes of models definable by a **single** infinitary modal formula,
 - classes of models definable by a **class (!)** of infinitary modal formula,
 - intuitionistic propositional language
 - modal predicate language
- [Areces, Carreiro, Figueira, 2014]: general criteria for an arbitrary language that is a “suitable” fragment of the first-order language, but:
 - their results apply only to classes of **pointed** models,
 - so the task is to extend (if possible) their results to classes of models.

Further directions

- Criteria for other semantics of the modal language:
 - neighbourhood semantics
 - topological semantics
 - algebraic semantics
- Criteria for other languages:
 - add modalities: converse (tense) \square^{-1} , inequality $[\neq]$, transitive closure \boxplus , graded modalities $\diamond^{\geq n}$, hybrid logic (nominals) $@_i$;
 - infinitary modal language (for any set Φ of formulas $\bigwedge \Phi$ is a formula):
 - classes of models definable by a **single** infinitary modal formula,
 - classes of models definable by a **class (!)** of infinitary modal formula,
 - intuitionistic propositional language
 - modal predicate language
- [Areces, Carreiro, Figueira, 2014]: general criteria for an arbitrary language that is a “suitable” fragment of the first-order language, but:
 - their results apply only to classes of **pointed** models,
 - so the task is to extend (if possible) their results to classes of models.

Thank you!

The modality of inequality $[\neq]$ | Check!

Theorem: for pointed models (M. de Rijke, 1992; E.Z. 2017)
